

Lab Performance 2

Inheritance

Question1:

You are asked to model an employee system with proper constructors:

- **Person** class with attributes name and age, and a constructor to initialize them.
- **Employee** class (inherits from Person) with an additional attribute employee_id, and a constructor that calls the parent class constructor using super().
- **Manager** class (inherits from Employee) with an extra attribute department, and a constructor that calls the Employee constructor properly.

✓ Bonus Challenge:

- Create an object of Manager, and display all attributes.
- Also, add a method in Manager to **override** the display() method from Person, showing full details including department.

Question2:

Design a system for gadgets with method overriding and constructors:

- **Gadget** (base class) with attribute brand, a constructor, and method show_info().
- **Laptop** (inherits from Gadget) with attribute ram_size, its own constructor, and override show_info() to show brand and RAM size.
- **Smartphone** (inherits from Gadget) with attribute camera_megapixels, its own constructor, and override show_info() to show brand and camera specs.

✓ Bonus Challenge:

- Create objects of Laptop and Smartphone.
- Call their show_info() methods to demonstrate **method overriding**.
